Central Provisioning of Algo SIP Endpoints

Algo SIP endpoints support central provisioning. Configuration tips and guides are available below for reference.

Provisioning Guide

Provisioning Parameters Guide

Where it is necessary to manage and configure a large number of devices, central provisioning eliminates the need to log into each endpoint web interface. As a result, central provisioning can save time and ensure consistent configuration setups. Provisioning is also a method by which to pre-configure units prior to installation on the final network.

The concept is simple. Configuration files can be placed on a central server. Algo endpoints can then be pointed to fetch these configuration files. Such files can be easily made by downloading a backup of the settings currently on a device.

To provision an Algo endpoint, three steps are necessary:

- Provide the Algo endpoint device with the address of the provisioning server.
- Create the desired configuration files, and place these on the provisioning server.
- Reboot the device.

These steps are described in more detail in the **Provisioning Guide.**
